

Write each pair of fractions with the same denominator.  
Write  $<$  or  $>$  between each pair.

5 fits into 10 so we can change the denominator.  
Don't forget to change the numerator too!

$$\frac{2}{5} \quad \frac{3}{10}$$

$$\frac{4}{10} > \frac{3}{10}$$

1  $\frac{2}{3}$   $\frac{4}{9}$

2  $\frac{4}{5}$   $\frac{3}{10}$

3  $\frac{5}{6}$   $\frac{2}{3}$

4  $\frac{3}{8}$   $\frac{1}{2}$

5  $\frac{3}{4}$   $\frac{5}{8}$

6  $\frac{1}{3}$   $\frac{2}{9}$

7  $\frac{7}{8}$   $\frac{3}{4}$

8  $\frac{7}{12}$   $\frac{3}{4}$

9  $\frac{5}{6}$   $\frac{11}{12}$

10  $\frac{2}{3}$   $\frac{7}{12}$

Write three fractions where the first is half of the second and the second is half of the third. Work with a partner to write three sets of fractions like this.

I am confident with comparing related fractions.
